Table I: Source-paired NeST–ARPC differences at $N = 2048$.

Condition	ΔPSNR (dB) [95% CI]	ΔDISTS [95% CI]
4 dB adaptive	3.779 [3.493, 4.082]	−0.1128 [−0.1246, −0.1013]
10 dB adaptive	3.877 [3.688, 4.079]	−0.0568 [−0.0612, −0.0521]
19 dB full representations	1.806 [1.742, 1.871]	0.0054 [0.0024, 0.0086]

Δ = NeST − ARPC. Matched100; three noise realizations per source; 300/300 correctly delivered frames per method and condition. Intervals are direct source-paired 95% CIs. Positive ΔPSNR favors NeST; positive ΔDISTS favors ARPC. Adaptive 4/10 dB and full-representation 19 dB use different frozen configurations.
