

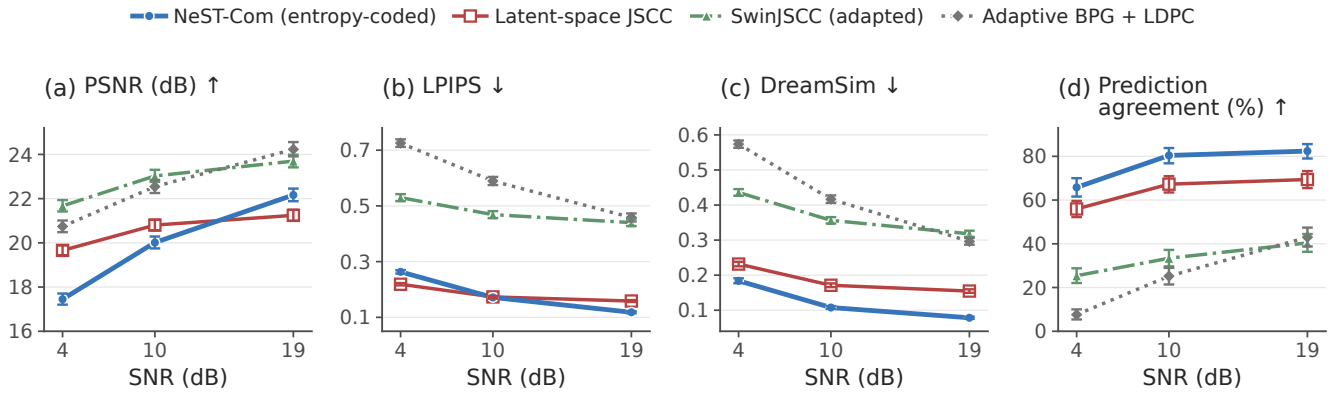

Fig. 2. Reconstruction performance at $N = 1024$ on the original common500 images. Markers show source-averaged means and error bars show pointwise 95% source-level bootstrap intervals after averaging three channel realizations per source. The entropy-coded method uses the corrected m10-enabled policy at 19 dB. Latent-space JSCC and adapted SwinJSCC use their final 100k and 200k checkpoints. SNR is numerically spaced; prediction agreement is not label accuracy.

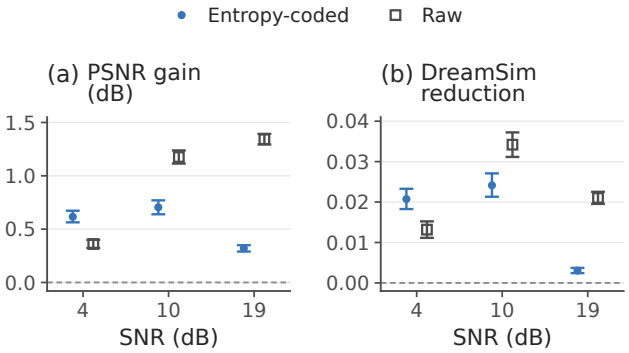

Fig. 3. Paired effects of within-scale truncation on common500 at $N = 1024$, evaluated separately for raw and entropy-coded source representations. Positive values indicate higher PSNR or lower DreamSim. Intervals are direct pointwise 95% source-paired bootstrap intervals after three-noise averaging. The entropy-coded 19 dB comparison includes m10 in both families. Horizontal positions are categorical operating points; the two series are offset for clarity. Original family-specific MCS settings are retained.

Review only: original manuscript widths; figures included without further scaling. Figure 2: 181.3533×55 mm. Figure 3: 88.5679×50 mm. Print this PDF at 100% (disable fit-to-page). No new experiments, scoring, or bootstrap. Full captions and provenance accompany the figures.
